Numbers

Real ~~*Complex*~~

Numbers are **mathematical objects used to represent quantities.**

They can be classified into different types based on their properties. Here are some common types of numbers:

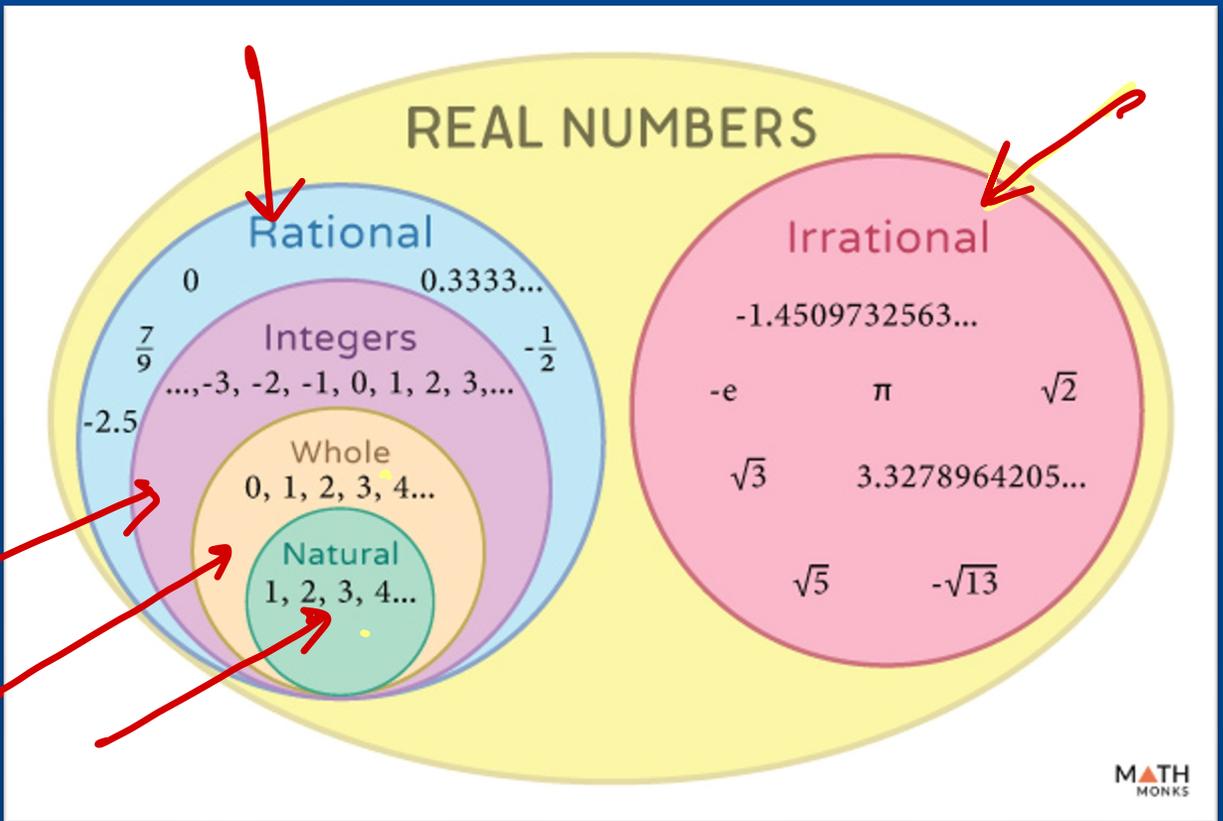

Real Numbers (R)

Real numbers can be defined as the union of both rational and irrational numbers.

Symbol : R

R

Natural Numbers (N) :

1 → ∞

Natural numbers are known as counting numbers that contain the positive integers from **1 to infinity.**

Symbol : N

Example : N = {1, 2, 3, 4, 5,}

Whole Numbers (W) :

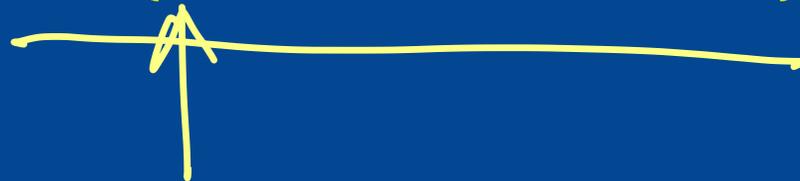

'0'

0, 1, 2, 3, ...

Whole numbers are known as non-negative integers and it does not include any fractional or decimal part.

Symbol : W

Example : W = {0, 1, 2, 3, 4, 5,}

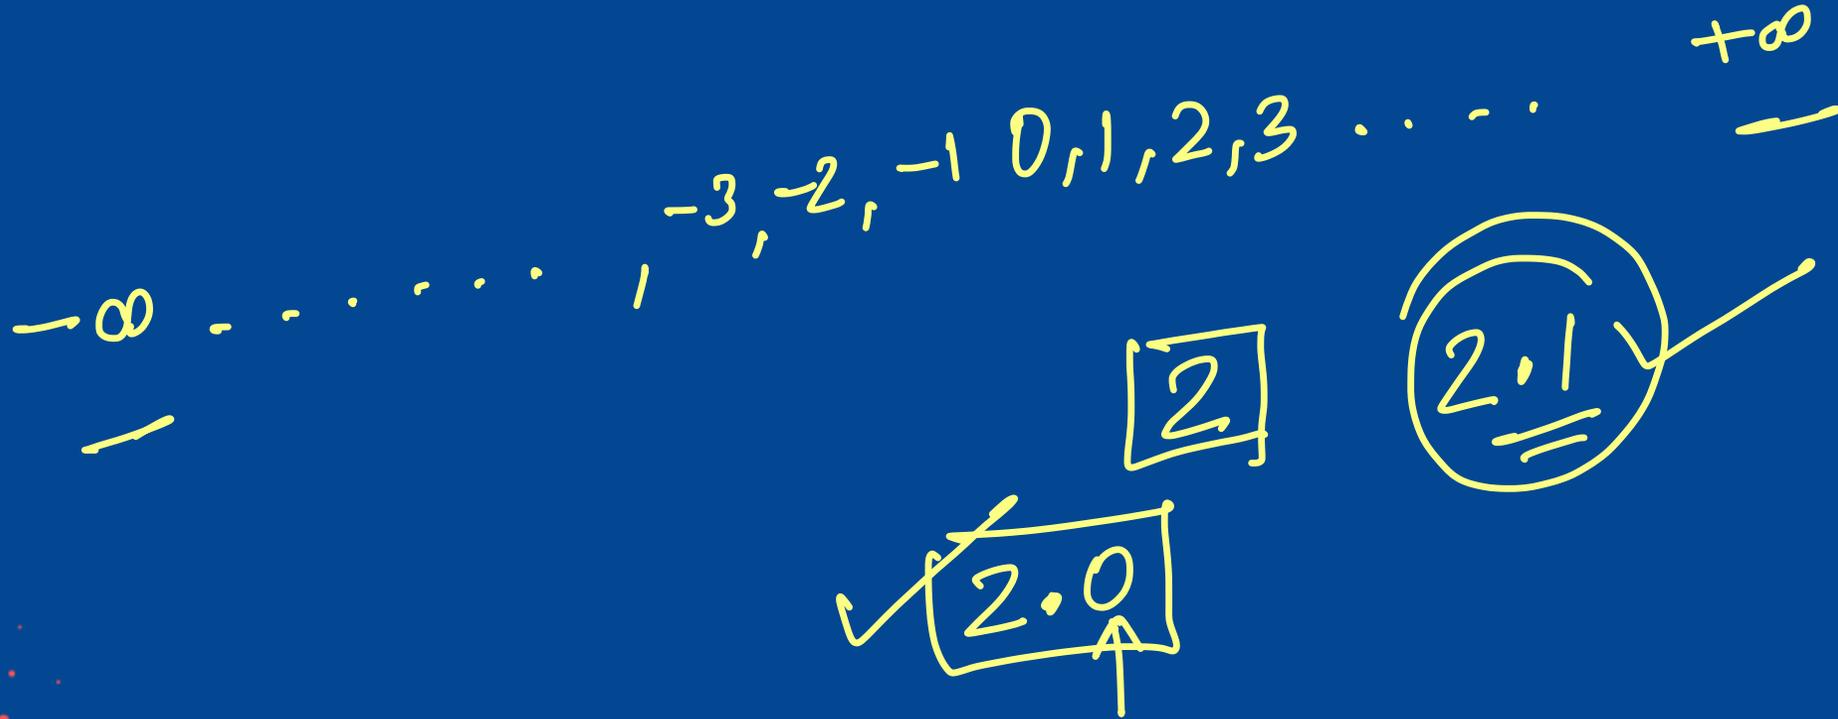

Integers (Z) :

Integers are the set of all whole numbers but it includes a negative set of natural numbers also.

Symbol : Z

Example : $Z = \{-3, -2, -1, 0, 1, 2, 3\}$

Rational Numbers (Q) : Every (I) is a Rational No

- The numbers of the form m/n are called rational numbers.
- Here, m and n are integers but n is not zero.

Symbol : Q

Example : $1/2, -3/4, 7,$ etc.

$$\frac{m}{n} / \frac{p}{q}$$

💡 **TIP – Recurring or Terminating**

$1.5, 2.52, \dots$

$$1.33333 \approx 1.\bar{3}$$
$$1.525252 \dots \approx 1.\overline{52}$$

Irrational Numbers (P)

- Irrational numbers are real numbers that cannot be represented as simple fractions.
- An irrational number cannot be expressed as a ratio, such as p/q , where p and q are integers,

Symbol : P

Example : $\sqrt{2}$, $\sqrt{5}$, π , $-e$, $-1.4556871.....$ etc.

💡 **TIP – Non-Recurring or Non-Terminating**

$\pi, -e$

$3.721342...$

$\left. \begin{array}{c} \sqrt{2} \\ \sqrt{3} \\ \sqrt{5} \end{array} \right\}$

Apart from the above, there exist other numbers :

Even Numbers : 0, 2, 4, 6, 8

$$\frac{0}{2} \quad \text{R} = 0''$$

The numbers which are exactly divisible by 2, are called even numbers. These can be positive or negative integers such as -42, -36, -12, 2, 4, 8 and so on.

Example :

Even Numbers Chart 1 - 100

Odd Numbers::

The numbers which are not exactly divisible by 2, are called odd numbers. These can be both positive and negative integers such as -3, -15, 7, 9, 17, 25 and so on.

$$R = 1$$

Prime Numbers:

Prime numbers are the numbers that have two factors only. (i.e.,) 1 and the number itself.

In other words, the number which is divided by 1 and the number itself is called prime numbers.

For example: 2, 3, 5, 7, 11, etc.

All Prime Nos. are Odd

Compare the following numbers.

The following rules are useful to compare two rational numbers.

If $\frac{a}{b}$ and $\frac{c}{d}$ are rational numbers such that b and d are positive, and

(1) if $a \times d < b \times c$ then $\frac{a}{b} < \frac{c}{d}$

(2) if $a \times d = b \times c$ then $\frac{a}{b} = \frac{c}{d}$

(3) if $a \times d > b \times c$ then $\frac{a}{b} > \frac{c}{d}$

$\frac{4}{3}$ and $\frac{1}{2}$

4×2 3×1

$\frac{8}{3} > \frac{3}{2}$

Compare the numbers $\frac{5}{4}$ and $\frac{2}{3}$. Write using the proper symbol of $<$, $=$, $>$.

$$\frac{5}{4} > \frac{2}{3}$$

$$5 \times 3 \qquad 2 \times 4$$

$$15 > 8$$

1. The product of two numbers is $\underline{-20/9}$. If one of the numbers is 4, find the other.

- ✓ (a) $-5/9$
- (b) $3/11$
- (c) $12/39$
- (d) $-9/11$

(A)

$$4 \times x = \frac{-20}{9}$$
$$x = \frac{-20}{9 \times 4}$$

$$x = \frac{-5}{9}$$

2. Fill in the blanks: $5/12 \div (\quad) = -35/18$

- (a) $-21/36$
- (b) $-12/19$
- (c) $-5/18$
- (d) $-3/14$**

$$\frac{3}{-14} = \frac{-3}{14} = -\frac{3}{14}$$

$$\frac{5}{12} \div (\quad) = \frac{-35}{18}$$

$$\frac{5}{12} \div \left(\frac{\quad}{\quad}\right) = \left(\frac{-35}{18}\right)$$

Handwritten work for the division problem:

$$\frac{5}{12} \div \frac{-35}{18} = \left(\frac{\quad}{\quad}\right)$$

Step 1: $\frac{5}{12} \times \frac{18}{-35} = \frac{\quad}{\quad}$

Step 2: $\frac{5 \times 18}{12 \times -35} = \frac{90}{-420}$

Step 3: $\frac{90 \div 30}{-420 \div 30} = \frac{3}{-14}$

3. The value of $(-16/21 \div -4/3)$ is _____

- (a) $-3/10$
- (b) $-7/21$
- (c) $4/7$
- (d) $-7/6$

$$\frac{-16}{21} \div \frac{-4}{3} =$$

$$= \frac{\cancel{4}^{4} \times \cancel{3}^1}{\cancel{21}^7 \times \cancel{4}^1} =$$

$$= \frac{4}{7}$$

4. The sum of two rational numbers is -7. If one of the numbers is $-\frac{15}{19}$, the other number is _____

- (a) $-\frac{21}{10}$
- (b) $-\frac{57}{16}$
- (c) $\frac{7}{9}$
- (d) $-\frac{118}{19}$

(D)

$$-7 + \frac{15}{19}$$

$$\left[\frac{-15}{19} \right] + x = -7$$
$$= \frac{-133 + 15}{1 \times 19} x = -7 - \left[\frac{-15}{19} \right]$$
$$= \frac{-118}{19} = -7 + \frac{15}{19}$$

5. Simplify: $\frac{2}{3} + -\frac{4}{5} + \frac{7}{15} + -\frac{11}{20}$

(a) $-\frac{1}{5}$

(b) $-\frac{13}{60}$

(c) $-\frac{4}{15}$

(d) $-\frac{7}{30}$

$$\frac{2}{3} + \left(-\frac{4}{5}\right) + \frac{7}{15} + \left(-\frac{11}{20}\right)$$
