Arithmetical Problems

This topic addresses general arithmetic problems, requiring common sense along with a touch of logical reasoning for their solutions.

Requirements:

1. Understanding of linear equations and their solutions
2. Basics of Number System
3. Basic Maths

A mother told her son, "When you were born my age was the same as your present age". If 5 yr ago, the age of son is 16 yr, then find out the present age of the mother.

- (a) 42 yr (b) 32 yr (c) 38 yr (d) 37 yr

When
=
Mother = $x + x$
= $2x$
= 2×21
= 42 yrs

Son's present age = ' x '

$$x - 5 = 16$$

$$x = 16 + 5$$

$$x = 21$$

Mani is double the age of Prabhu. Ramona is half the age of Prabhu. If the age of Mani is 60 yr, find out the age of Ramona.

(a) 20 yr

(b) 15 yr

(c) 10 yr

(d) 24 yr

$$\text{Mani} = 2x = 60 \text{ yrs}$$

$$\text{Ramona} = \frac{x}{2}$$

$$= \frac{30}{2} = 15 \text{ yrs}$$

$$\begin{aligned} 2x &= 60 \\ x &= \frac{60}{2} \end{aligned}$$

$$\boxed{x = 30}$$

Govind = 48 yrs.

Govind is 48 yr old. He is twice as old as his son Prem is now. How old was Prem seven years before? x

(a) 16 yr

(b) 17 yr

(c) 13 yr

(d) 18 yr

$$48 = 2x$$

$$\frac{48}{2} = x \Rightarrow \underline{x = 24}$$

$$x - 7 = 24 - 7 \\ = \textcircled{17}$$

The sum of Reena's and her father's age is 60 yr and the difference between their age is 36 yr.

What is Reena's father's age?

- (a) 58 yr (b) 60 yr (c) ~~48~~ yr (d) 52 yr

$$\begin{array}{r} \downarrow \\ x + y = 60 \\ + \quad x - y = 36 \\ \hline 2x = 96 \\ x = \frac{96}{2} \\ \boxed{x = 48} \end{array}$$

20 yr ago, Antony's age was $\frac{1}{2}$ of what his age now is.
What is his age now?

(a) 20 yr

(b) 40 yr

(c) 35 yr

(d) 30 yr

present \boxed{x}

$$x - 20 = \frac{x}{2}$$

$$2(x - 20) = x$$

$$2x - 40 = x$$

$$2x - x = 40$$

$$\boxed{x = 40}$$

Mr. Mani's age is 47 yr and John's age is 13 yr. In how many years will Mr. Mani's age be double of John's age?

(a) 20 yr

(b) 21 yr

(c) 10 yr

(d) 15 yr

present \Rightarrow Mani John
68 \leftarrow 47 13 \Rightarrow 34

$$47 + x = 2(13 + x)$$

$$47 + x = 26 + 2x$$

$$47 - 26 = 2x - x$$
$$\boxed{21 = x}$$

The ratio of two numbers is 3:5 and their LCM is 300. Then, one of the numbers will be

$$\frac{x}{y} = \frac{3}{5} \text{ (m)}$$

(a) 30

(b) 50

(c) 60

(d) 75

Product of 2 nos = LCM \times HCF

$$\begin{aligned} \text{First} &= 3m = \boxed{60} \\ \text{2nd} &= 5m = \boxed{100} \end{aligned}$$

$$x \times y \times [\text{HCF}] = \text{LCM} \times \text{HCF}$$

$$\text{lowest ratio product of 2 number} = \text{LCM} \\ \times \text{HCF}$$

$$\underline{3 \times 5} \times m = 300$$

$$15 \times m = 300$$

$$m = 300/15 = \boxed{20}$$

60% of students in a school are boys. The number of ^{Girls} girls in the school is 300, then the number of boys is = 40%.

(a) 500

(b) 300

(c) 450

(d) 750

Students = x

$$\frac{40}{100} \times x = 300$$

$$x = \frac{300 \times 100}{40}$$

$$x = \underline{\underline{750}}$$

$$\frac{750 - 300}{450}$$

Three friends A, B and C have different amounts of rupees with them. If B takes Rs.7 from A, then B will have equal amount as C has. B and C together have total Rs.157. How many rupees does C have?

(a) 80

(b) 81

(c) 83

(d) 82

A B C

x y z

x-7 y+7 z

$$y+7 = z$$

$$\begin{aligned} y-z &= -7 \\ + \quad y+z &= 157 \end{aligned}$$

$$2y = 150$$

$$y = \underline{\underline{75}}$$

$$\begin{aligned} z &= 75 + 7 \\ &= \underline{\underline{82}} \end{aligned}$$

If the speed of a train is 92.4 km/h, then how many metres are covered by it in 20 min? $t = 20 \times 60$

- (a) 30800 m (b) 32800 m (c) 38200 m (d) 38000 m

$$\text{km/h} \longrightarrow \text{m/s}$$

$$d = s \times t$$

$$s = 92.4 \times \frac{5}{18} \text{ m/s}$$

$$\begin{aligned} d &= \overset{308}{\cancel{924}} \times \frac{5}{\cancel{18}} \times 20 \times \cancel{60} = 308 \times 5 \times 20 \\ &= 308 \times 100 \\ &= \underline{\underline{30800 \text{ m}}} \end{aligned}$$

The difference between the squares of two consecutive numbers is 47. The numbers are

(a) 24, 25

(b) 23, 24

(c) 22, 23

(d) 21, 22

$x, x+1$

3, 4

5, 6

19, 20

$$(x+1)^2 - x^2 = 47$$

$$\cancel{x^2} + 2x + 1 - \cancel{x^2} = 47$$

$$2x = 47 - 1$$

$$2x = 46$$

$$x = \underline{23}$$

$$x+1 = \underline{24}$$

While travelling by bus, a man spent 60 more than 10 times the fare he paid for an auto rickshaw. The total amount spent by him is 13 times the fare he paid for an auto rickshaw.

$bus = x$ $auto = y$

What total amount of money was spent on bus as well as auto rickshaw by the man?

(a) Rs.60

(b) Rs.30

(c) Rs.390

(d) Rs.570

$x = 10y + 60$

$x + y = 13y = 13 \times 30 = 390$

$x = 12y$

$12y = 10y + 60$

$2y = 60$

$y = 30$
